The *TrendWright* trending software was designed to log and trend data on an existing Automax network using a module or “black box” recently designed by QTSI. The software was designed with simplicity in mind. With very little effort, variables can be extracted from an existing Automax PLC and imported without any required additional changes to variables. Thanks to newer hard drives, months to years of raw data can be collected. These data files are non-volatile and are retained during power cycles of the PC.

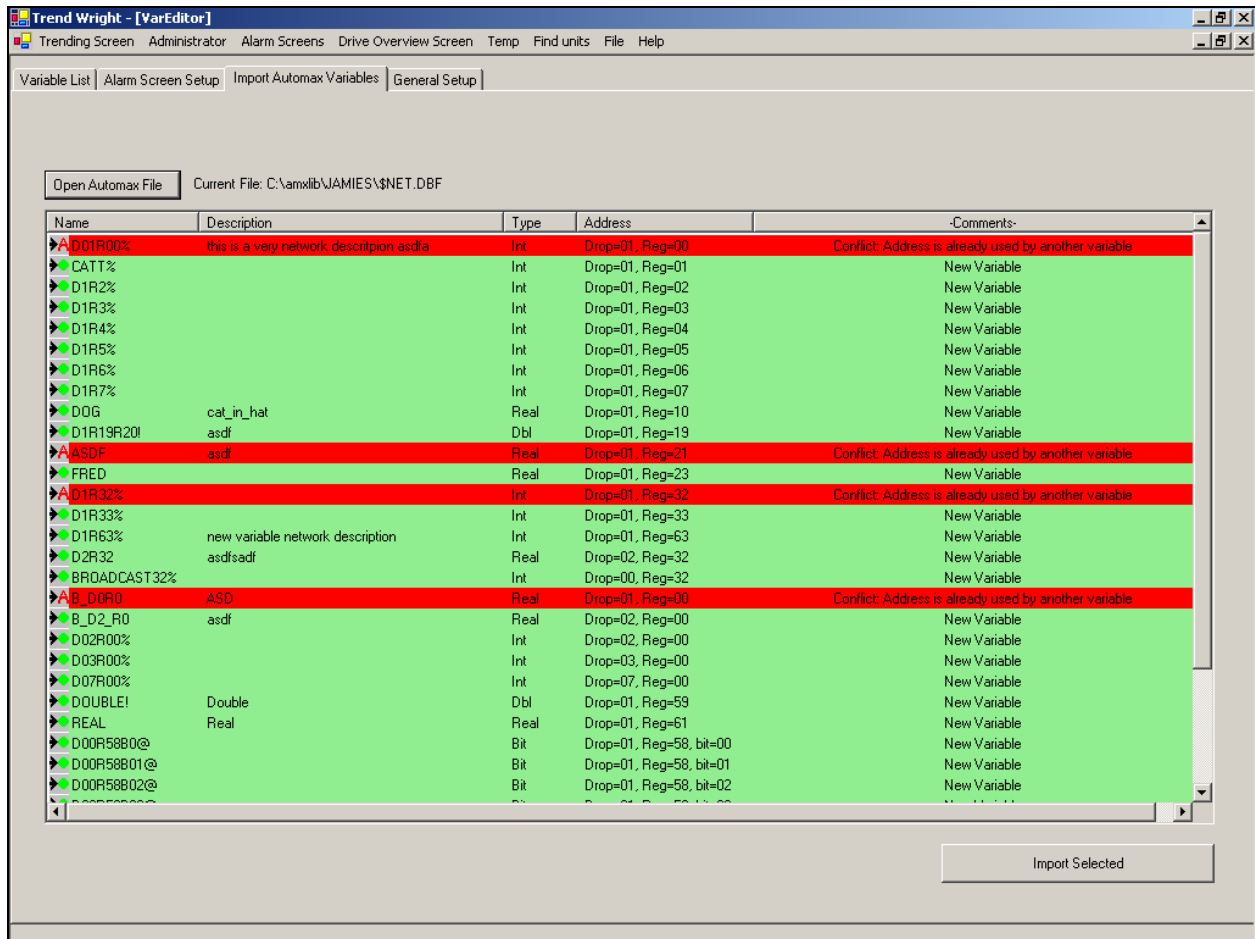

Basic trending setup takes only a matter of minutes to import all of the existing network variables. Filters are available to select subsets if desired.

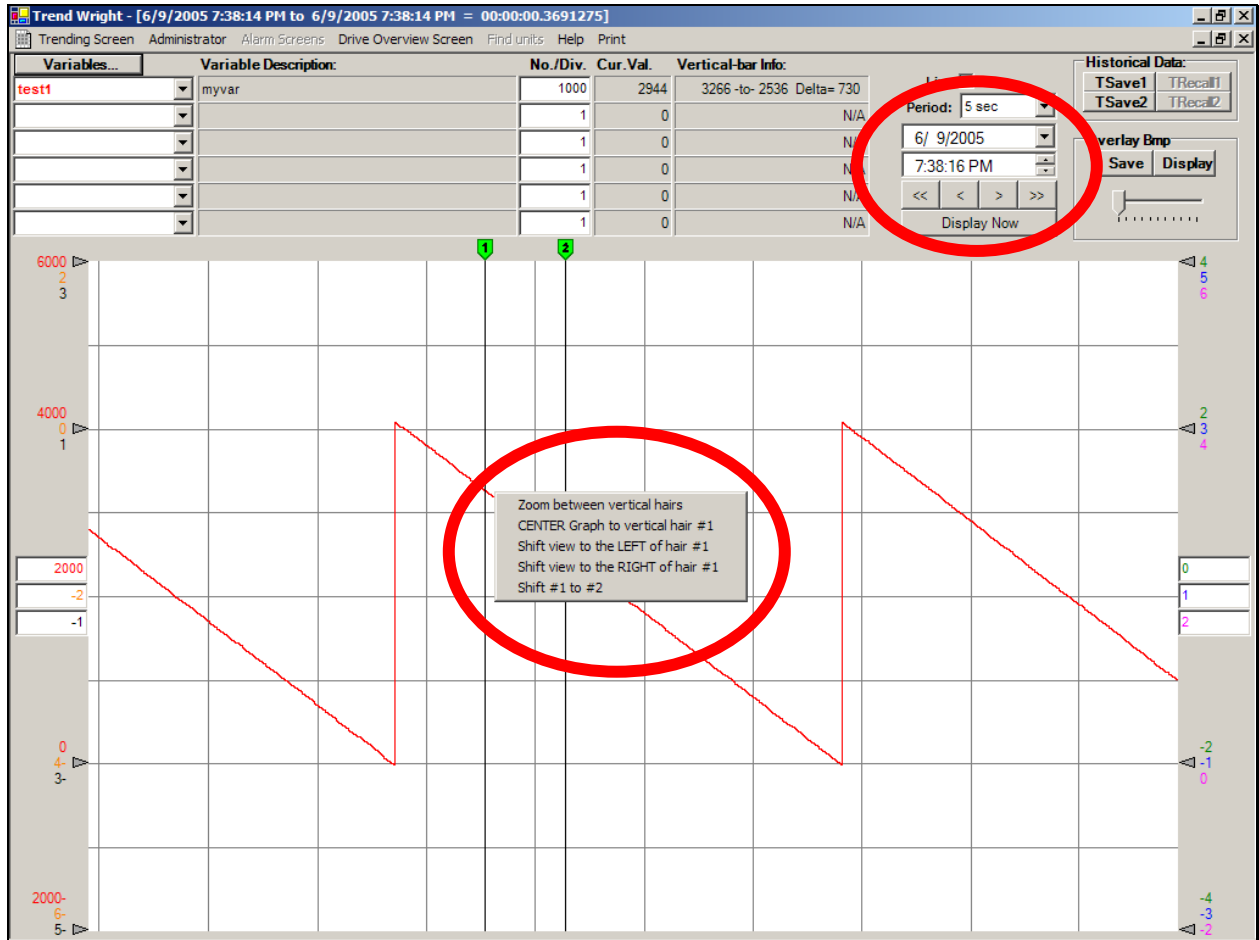

All pens can be individually scaled and offset to engineering units.

Pen names can be changed to more descriptive names if desired.

If a trend pen is added for a variable that was not previously selected but on the network all the historical data for that pen is immediately available.

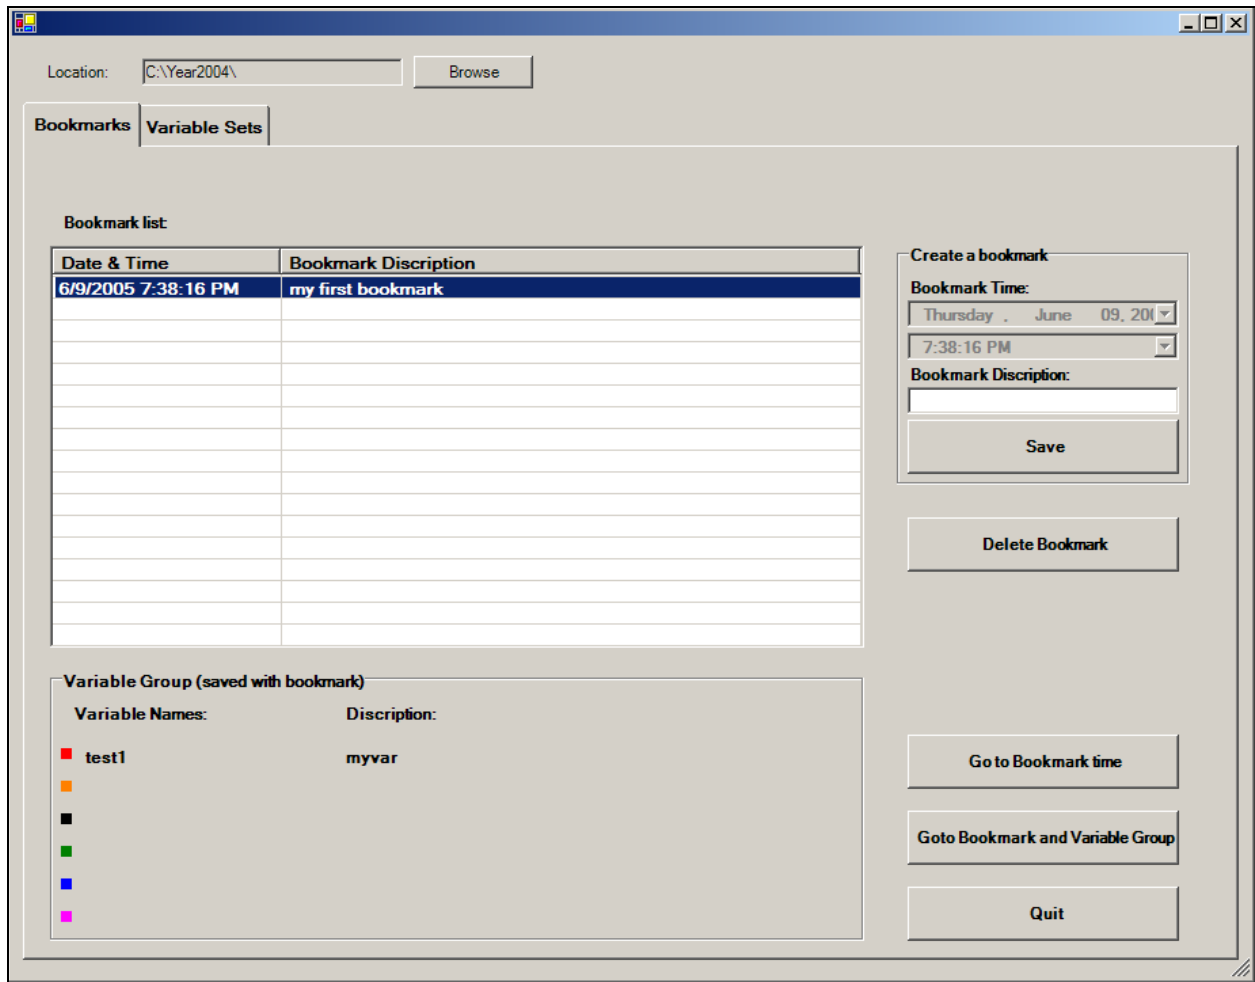

A feature of the trending includes the ability to recall a date, time, and time range you wish to see. There is also the ability to do on-graph zooming, and shifting the graph with a right mouse click.

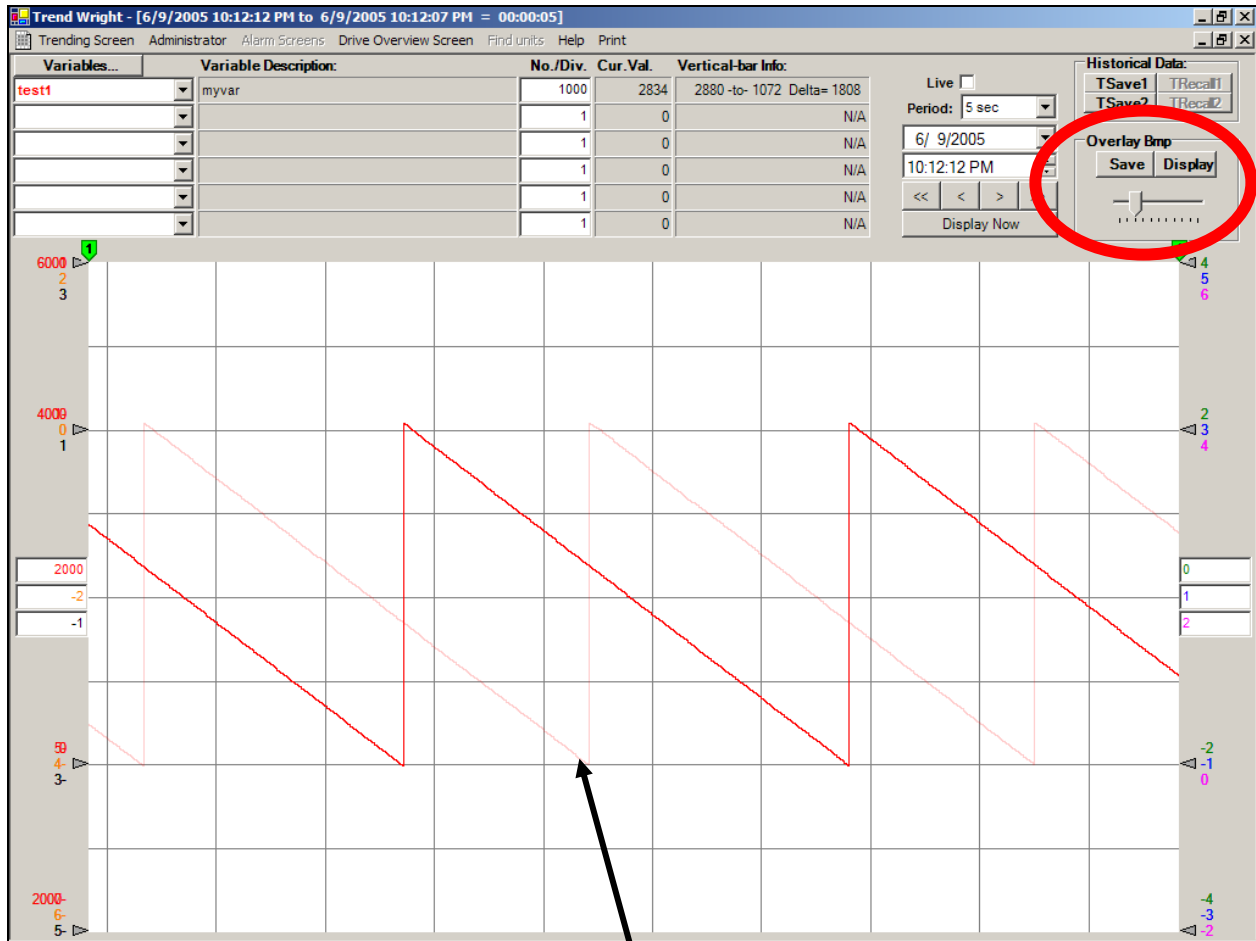

If a particular trend is of interest, you can “bookmark” the time with the plotting pens that were used.

Another feature called “variable sets” allows saving the current set of active pens. Commonly used sets of pens can then be recalled.

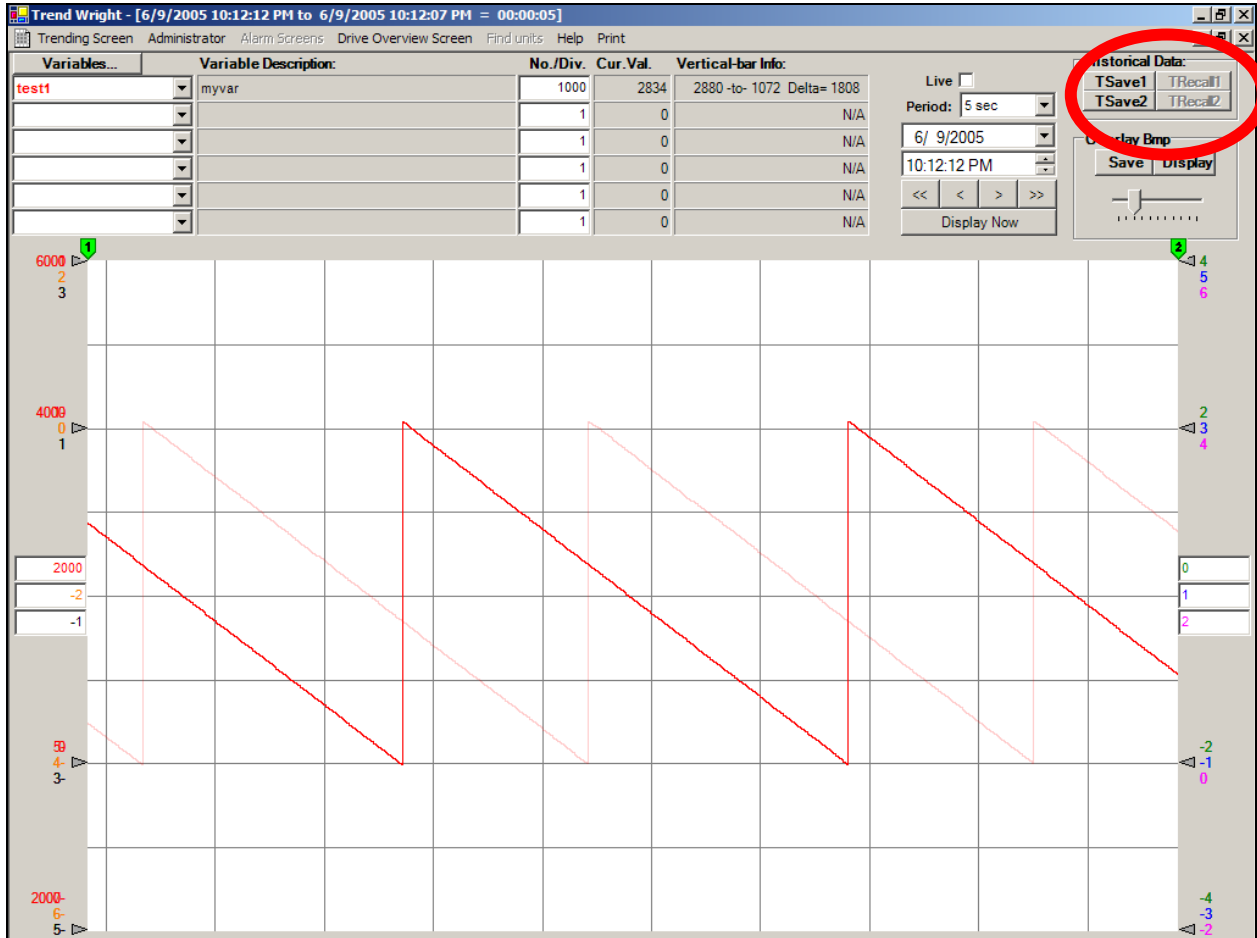

A feature of interest to people who tune drives is the overlay function. This feature takes a snap-shot of a graph that was displayed, and overlays it on a new graph. This allows for easier comparison of drive tuning responses. The opacity of the saved image can be changed to suit the desired visibility.

Overlaid image saved from a previously displayed graph.

Four buttons allow taking quick snap shots and displaying them later. This is similar to the memory save/recall function of a pocket calculator.

The "print" function prints a simplified chart without irrelevant screen controls shown. Background colors are selected to save ink. (sample below.)
